

## **TODO: Create UAT plans for at least 3 features**

### **remember**

You have to execute this test plan in week 4 of your project. So it would be ideal if your test plan is well thought through as it will expedite the testing process.

1. Create 1 document per team, within the **milestones** folder in the project directory, that describes how, at least, 3 features within your finished product will be tested.
2. The test plans should include specific test cases (user acceptance test cases) that describe the data and the user activity that will be executed in order to verify proper functionality of the feature.
3. The test plans should include a description of the test data that will be used to test the feature.
4. The test plans should include a description of the test environment ( localhost / cloud ) that will be used to test the feature.
5. The test plans should include a description of the test results that will be used to test the feature.
6. The test plan should include information about the user acceptance testers.
7. The actual test results based on observations after executing the tests.

**Your team will include these test cases and the observation results in the final project report.**

Features (localhost as test env for all)

1. Sending a friend request

Test Data:

- User sends a friend request to an existing user that appears when searching their username

Expected Results:

- No error occurs
- Alert occurs that informs the user that a request was sent
- Request appears in “sent requests” section

2. Accepting a friend request

Test Data:

- Request exists in “pending requests” section
- User click accept

Expected results

- No error occurs

- Alert occurs that informs the user that the request was accepted
- User now appears in active friends list

### 3. Posting a review

Test Data:

- Enter valid data in each required field
- Click post

Expected Results

- No error occurs
- Post appears under the user's posts in profile
